### 1.0 Introduction

This Traffic Report was developed in order to achieve the following goals:

- Identify the pedestrian and bicyclist safety issues that exist at the intersection of Highway 91 and State Street.
- Identify and evaluate potential countermeasures to address current and longterm needs.
- Evaluate the effectiveness of the temporary pedestrian crossing.
- Recommend select countermeasures for implementation.

### 1.1 Background

Highway 91, also known as Johnson Avenue, serves as a principal arterial facility running east-west connecting Arkansas State University to downtown Jonesboro. The existing facility consists of four traffic lanes with a two-way left turn lane (TWLTL), with curb and gutter and sidewalks present along both sides of the roadway. Highway 91 has a posted speed limit of 45 miles per hour (mph).

The intersection of Highway 91 and State Street is a four-leg intersection with two-way stop control (TWSC) on the minor approaches (State Street). The eastbound and westbound approaches include a left turn lane, a through lane, and shared through/right lane. The northbound and southbound approaches consist of a shared left/through/right lane. The study intersection is shown in Figure $\mathbf{1}$ on the following page. Figure $\mathbf{2}$ shows a pedestrian crossing Highway 91 on the west leg of this intersection, which is a common occurrence.

Figure 1: Highway 91 and State Street Intersection

Figure 2: Pedestrian Crossing Highway 91 prior to Installation

Hwy. 91 STEP Innovation Study (Jonesboro) (S)
Final Traffic Report

On September 27, 2019, a temporary pedestrian crossing was installed west of the study intersection. The temporary pedestrian crossing consists of a marked crosswalk with continental type markings, W11-2 pedestrian signs with arrow on each end of the crosswalk and in the median, warning beacons for each pedestrian sign, concrete curbs within the median, yield markings, advance signs located 400 feet prior to the crosswalk, and improved lighting at the crosswalk. Figure 3 shows the layout of the temporary pedestrian crossing.

Figure 3: Temporary Pedestrian Crossing

Hwy. 91 STEP Innovation Study (Jonesboro) (S)

### 2.0 Existing Conditions

In order to identify and evaluate appropriate countermeasures for pedestrian and bicyclist safety issues for the intersection of Hwy 91 and State Street, data was collected, and existing conditions were observed prior to and after installation of the temporary pedestrian crossing. The findings from this effort are described in the following subsections.

### 2.1 Data Collection

The following data was collected for this study:

- Prior to installation of the temporary pedestrian crossing
- Crash data from 2014 to 2018 were compiled for the study intersection. Data revealed angle crashes to be the most common crash type. An average of 11 crashes per year occurred at the study intersection.
- Crash reports involving pedestrians from 2009 to 2017 at or near the study intersection were provided. This data revealed that five pedestrian-related crashes occurred on Highway 91 between State Street and Melrose Avenue, which is located approximately 525 feet east of State Street.
- The City of Jonesboro provided vehicular and pedestrian counts for the study intersection conducted on April 29, 2019 from 7:00 AM to 8:00 PM. Table 1 summarizes the pedestrian counts collected. Complete traffic data is provided in Appendix A - Traffic Data. As shown in Table 1, the highest crossing activity occurred across the west leg of the intersection with 174 pedestrians crossing Highway 91 within the 13-hour period. Data show the
pedestrian peak hour to be from 4:00 PM to 5:00 PM with 27 pedestrians per hour (pph) crossing Highway 91 at State Street.
- The Average Daily Traffic (ADT) volume for Highway 91 was obtained from an ARDOT permanent count station (Station ID 160201 located east of Melrose Street), which shows a 2018 ADT of 19,000 vehicles per day (vpd).

Table 1: Pedestrian Crossing Counts Prior to Installation

| Time Period |  | Pedestrian Counts at Hwy 91 and State St Intersection |  |  |  |  |

| Total |  | 57 | 10 | 33 | 174 | 184 |

- After installation of the temporary pedestrian crossing
- Pedestrians and bicyclists crossing Highway 91 at the temporary pedestrian crossing were counted during peak time periods on Thursday, October 3, 2019 and Wednesday, March 4, 2020. Table 2 in the following page summarizes the results of these counts. This data is also provided in Appendix A - Traffic Data. No bicyclists were present during either count.

Table 2: Pedestrian Crossing Counts After Installation

| Time Period |  | Pedestrian Counts at Hwy 91 and <br> State St Intersection |  |
| :---: | :---: | :---: | :---: |
| From | To | 3-Oct-19 | 4-Mar-20 |
| 7:00 AM | 9:00 AM | 32 | 21 |
| 11:30 AM | $1: 30$ PM | 15 | 26 |
| $4: 00$ PM | $6: 00$ PM | 26 | 33 |
| Total |  | 73 | 80 |

- ARDOT provided crash data for crashes that occurred after installation of the temporary pedestrian crossing (September 27, 2019 to March 19, 2020). A total of 11 crashes occurred at the intersection including one pedestrian related crash.

### 2.2 Site Visit Observations

Highway 91 is comprised of two lanes in each direction with a TWLTL. The speed limit is 45 mph , but vehicles often speed through this area. Just west of State Street is a Citgo gas station to the south of Highway 91 and apartment complexes to the north of Highway 91. Pedestrians often cross Highway 91 to go between the gas station and the apartment complexes. The proximity of this site to Arkansas State University also generates heavy pedestrian and bicyclist traffic. Prior to the temporary pedestrian crossing, pedestrians were observed to cross Highway 91 roughly every 5 to 10 minutes throughout the rush hours. These pedestrians often had difficulty finding adequate gaps in traffic. On September 27, 2019, the temporary pedestrian crossing shown in Figures 4 and 5 was installed across Highway 91 just west of State Street. This crossing has been monitored to determine its effectiveness at improving safety for pedestrians and bicyclists.

Figure 4: Temporary Pedestrian Crossing across Highway 91

Hwy. 91 STEP Innovation Study
(Jonesboro) (S)
Final Traffic Report

Figure 5: Temporary Pedestrian Crossing across Highway 91

On October 3, 2019, observations were conducted by MPO staff during the morning, midday, and evening peaks. Pedestrians within the area provided overwhelmingly positive feedback on the installment of the temporary crossing. While most pedestrians utilized the crossing installation, a few pedestrians were observed during each of the peak periods crossing within just 2-5 feet of the actual crossing installation (mainly on the west

Hwy. 91 STEP Innovation Study (Jonesboro) (S)
Final Traffic Report
side). It was also noted that some pedestrians utilized the crossing installation without activating the lights. Vehicular traffic often did not yield to pedestrians even when the pedestrians were already crossing at the installation and the crossing lights were activated. Some motorists expressed annoyance with the crossing.

Public education and outreach efforts were employed in response to the unsafe driver behaviors that were observed. In addition, the Jonesboro Police Department sent available officers to patrol and monitor the site when possible. With police presence, the motorists generally drove cautiously and yielded to pedestrians. However, in the absence of police enforcement, problematic driving behaviors continued. Several crashes occurred at this location even months after the installation. Video clips of the crashes were reviewed, and the incidents are summarized in the following paragraphs.

Two crashes occurred on October 7, 2019. The first crash happened at approximately 11:00 AM when a speeding motorcyclist rear-ended a vehicle after the vehicle changed lanes without signaling. No injuries and no damage to the crossing resulted from this incident. At approximately 2:00 PM, another crash occurred when a vehicle made an illegal left turn from State Street onto Highway 91 and ran over the pedestrian island and signal. No pedestrians were present at the time of this incident, and no injuries occurred. The signal was repaired within the same day. As shown in Figure 6, this incident was reported to the public using news and social media such as Facebook to raise awareness of the crossing, the prohibited left turn, and enforcement of these regulations.

Figure 6: Public outreach in response to October 7 Crashes

On November 26, 2019, a pedestrian activated the flashing lights and was nearly half-way across the crosswalk when a speeding, distracted driver rear-ended a truck that was stopped and waiting for the pedestrian to cross. The pedestrian was able to back out of the way of the collision, and nobody was injured. Figure 7 shows the pedestrian running backwards to avoid this crash in the top picture, and the vehicular damage resulting from the crash in the bottom picture.

[^0]Figure 7: Rear-End Crash on November 26

On February 8, 2020, over four months after the temporary pedestrian crossing was installed, a pedestrian was hit and injured. The video footage of this incident demonstrates the widespread disregard of motorists for this pedestrian crossing. The pedestrian actuated the light and then had to wait 16 seconds before a driver finally stopped. During that 16 seconds of waiting, 10 vehicles sped through the crossing without

[^1]even slowing down. After a vehicle stopped in the inside lane, the pedestrian began to cross, and then two more vehicles sped through the crossing. One of these vehicles narrowly missed the pedestrian, as shown in the top picture of Figure 8. Two seconds later, three more vehicles sped through the crossing, and one of these vehicles hit the pedestrian as shown in the bottom picture of Figure 8.

Figure 8: Pedestrian Injury on February 8

On February 13, another rear-end crash occurred at the crosswalk. No injuries resulted, and the cause of the crash did not appear to be related to the pedestrian crossing. Speeding as well as turning into oncoming traffic at the last minute were contributing factors in this crash which is shown in Figure 9.

Hwy. 91 STEP Innovation Study (Jonesboro) (S)
Final Traffic Report

Figure 9: Crash on February 13

As is demonstrated by these crashes and ongoing observations, the following driver behaviors remain problematic even months after the temporary crossing has been installed: speeding, distracted driving, and failure to yield to pedestrians. In addition, the temporary crossing does not command a strong presence to drivers. The lights are not always activated by the pedestrians, and the signs do not draw drivers' attention to the crossing. Modifications in driver behavior and improved pedestrian safety were only achieved during active police presence.

### 3.0 Safety Analysis

Crash data for the intersection of Highway 91 and State Street were collected prior to and after installation of the temporary pedestrian crossing. As previously mentioned, available crash data for the last five years (2014 to 2018) were compiled along with crash data from September 27, 2019 to March 19, 2020. Table 3 presents the crash summary
based on crash type. At the study intersection, a total of 57 crashes were recorded from 2014 to 2018, which included two pedestrian-related crashes. Angle crashes were found to be the most prominent. After installation of the temporary pedestrian crossing, a total of 11 crashes occurred within six (6) months, approximately twice the crash rate of the previous five years. The majority of the crashes with the temporary installation in place were rear end crashes. One pedestrian-related crash took place on February 8, 2020. The pedestrian was walking on the crosswalk when struck by a vehicle traveling westbound on Highway 91.

Table 3: Crash Summary by Crash Type

| Time Period | Angle | Backing | Head On | Rear End | Sideswipe, <br> Opposite <br> Direction | Sideswipe, <br> Same <br> Direction | Single <br> Vehicle <br> Crash | Pedestrian | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2014 to 2018 | 27 | 0 | 0 | 13 | 1 | 12 | 2 | 2 | 57 |
| $9 / 27 / 2019$ to $3 / 19 / 2020$ | 2 | 0 | 0 | 6 | 0 | 2 | 0 | 1 | 11 |

### 4.0 Potential Countermeasures

Potential countermeasures to improve pedestrian safety were selected based on review of data collected and field observations as well as STEP Countermeasure tables provided by the Federal Highway Administration (FHWA).

The following potential countermeasures were identified:

- Apply countermeasures to reduce vehicle speeds through the area including raised medians, landscaping, and speed-monitoring trailers.
- Raised medians and landscaping can change the character of the street and reduce speeds. Appropriate vegetation can be planted in the raised
medians and existing buffer area between the sidewalk and street to reduce the visual width of the roadway. The speed-monitoring trailers can enhance speed compliance prior to implementing traffic-calming treatments.
- Install a traffic signal with pedestrian signal heads at the intersection of Highway 91 and State Street.
- This countermeasure may be considered if one or more traffic signal warrants are met.

Table 4 was produced by FHWA and shows STEP countermeasures that should be considered based on the lane configuration, posted speed limit and AADT of the corridor. The Highway 91 corridor has a posted speed limit of 45 mph and an AADT of 19,000 vpd. This corridor has two lanes in each direction and no raised median.

Table 4: Application of Pedestrian Crash Countermeasures by Roadway Feature (from FHWA)

*Refer to Chapter 4, "Using Table 1 and Table 2 to Select Countermeasures," for more information about using multiple countermeasures.
${ }^{* *}$ It should be noted that the PHB and RRFB are not both installed at the same crossing location.
This table was developed using information from: Zegeer, C.V., J.R. Stewart, H.H. Huang, P.A. Lagerwey, J. Feaganes, and B.J. Campbell. (2005). Safety effects of marked versus unmarked crosswalks at uncontrolled locations: Final report and recommended guidelines. FHWA, No. FHWA-HRT-04-100, Washington, D.C.; FHWA. Manual on Uniform Traffic Control Devices, 2009 Edition. (revised 2012). Chapter 4F, Pedestrian Hybrid Beacons. FHWA, Washington, D.C.; FHWA. Crash Modification Factors (CMF) Clearinghouse. http://www.cmfclearinghouse.orq/; FHWA. Pedestrian Safety Guide and Countermeasure Selection System (PEDSAFE). http://www.pedbikesafe.org/PEDSAFE/; Zegeer, C., R. Srinivasan, B. Lan, D. Carter, S. Smith, C. Sundstrom, N.J. Thirsk, J. Zegeer, C. Lyon, E. Ferguson, and R. Van Houten. (2017). NCHRP Report 841: Development of Crash Modification Factors for Uncontrolled Pedestrian Crossing Treatments. Transportation Research Board, Washington D.C.; Thomas, Thirsk, and Zegeer. (2016). NCHRP Synthesis 498: Application of Pedestrian Crossing Treatments for Streets and Highways. Transportation Research Board, Washington, D.C.; and personal interviews with selected pedestrian safety practitioners.

Based on the information provided in Table 4, the following countermeasures should be considered for Highway 91:

- High-visibility crosswalk markings, parking restrictions on crosswalk approach, adequate nighttime lighting levels, and crosswalk warning signs.
- Parking restrictions on crosswalk approach are not applicable to the study area since parking on the street is currently not allowed.
- The high-visibility crosswalk markings, adequate nighttime lighting levels, and crosswalk warning signs were installed as part of the temporary pedestrian crossing.
- Advance Yield Here To (Stop Here For) Pedestrians sign and yield (stop) line.
- These were installed as part of the temporary pedestrian crossing.
- Curb extension
- This countermeasure is not applicable since on-street parking is not allowed on this corridor.
- Pedestrian refuge island
- This countermeasure was installed as part of the temporary pedestrian crossing.
- Road Diet
- This countermeasure is not considered due to the high traffic volumes along Highway 91 (19,000 vpd).
- Pedestrian Hybrid Beacon (PHB)
- This countermeasure may be appropriate if pedestrians are unable to find adequate gaps in vehicular traffic to safely cross Highway 91. Further investigation of this countermeasure is performed in Section 5.0.

All applicable countermeasures from Table 4 are currently installed with the temporary pedestrian crossing except for the PHB.

As shown in Table 5 on the following page, FHWA provides another table of STEP countermeasures which are listed according to the safety issues that they address. The following safety issues were observed at the temporary pedestrian crossing:

- Conflicts at crossing locations
- Excessive vehicle speed
- Inadequate conspicuity/visibility
- Drivers not yielding to pedestrians in crosswalks

Table 5：Safety Issues Addressed Per Countermeasure（from FHWA）

| Pedestrian Crash Countermeasure for Uncontrolled Crossings | Safety Issue Addressed |  |  |  |  |

*Countermeasure will be investigated further before including as a recommendation.

### 5.0 Investigation of Countermeasures

Two (2) of the potential countermeasures that were identified require further investigation before being selected as a recommendation. These countermeasures are the PHB and traffic signal. The investigation of these countermeasures is detailed in the following subsections.

### 5.1 Pedestrian Hybrid Beacon

The PHB should be considered if a signal is not warranted but gaps in traffic are inadequate to permit pedestrians to cross. According to the Traffic Control Devices Handbook, Second Edition, an average of one gap per minute (60 gaps per hour) is needed to adequately allow pedestrians to cross the road. The number of available gaps of adequate length were estimated based on the road width, average pedestrian walking speed, and hourly vehicular volume. The volumes on the west approach of the intersection of Highway 91 at State Street were used for this analysis since this is a potential location for the PHB. Table 7 shows the results of the gap analysis. Based on

[^3]these results, pedestrians do not experience enough gaps in traffic of adequate length to safely cross Highway 91 during the day.

Table 7: Gap Analysis for the Pedestrian Hybrid Beacon

| From | To | Contributing Movement Volumes |  |  |  | \# Veh Crossing | Headway | Flow rate | Probability of no vehicles arriving during needed time to cross | Adequate Length Gaps/hr | Meets critical volume |

The Manual on Uniform Traffic Control Devices (MUTCD) provides a table of guidelines for the installation of PHB on high-speed roadways (more than 35 mph ) as shown in Figure 10 on the following page. These guidelines are not meant as mandatory warrants but rather as guidance. Based on this figure, a minimum of 20 pedestrians crossing per hour would be cause for considering the installation of a PHB. Pedestrian crossing data exhibited in Table 2 show the highest crossing activity occurred across Highway 91 between 4 pm to 5 pm with 27 pph . Hence, a PHB was considered further as an option to improve pedestrian safety and address the inadequacy of gaps in vehicular traffic for crossing safely.

[^4]Figure 10: Guidelines for Installation of PHB (MUTCD Figure 4F-2)

### 5.1.1 Vehicle Delay

In order to evaluate the impact to vehicular traffic resulting from the installation of a PHB, SimTraffic was used to compare the average delay per vehicle traveling through the study area under existing conditions (without the temporary crossing) versus conditions with one PHB installation west of State Street. The model utilized vehicular and pedestrian volumes for the vehicular PM peak hour (4:30 pm to $5: 30 \mathrm{pm}$ ) because the PM peak has the highest vehicular volumes and the highest pedestrian volumes. The model assumed that the PHB signal was actuated 18 times during the PM peak hour which is conservatively high based on pedestrian crossing data during the PM peak hour. The model also assumed 26 seconds for each pedestrian crossing phase (7 seconds of Walk time, 16 seconds of flashing Don't Walk time, and 3 seconds of all-red time). The flashing Don't Walk time was calculated based on MUTCD guidelines. The
results of the SimTraffic analysis are provided in Appendix B - Operational Analysis Results and are summarized in Table 8. As shown, installing one PHB would increase the average delay experienced by drivers within the study area during the busiest peak period by as much as 3.0 seconds per vehicle (an increase from 3.8 seconds per vehicle to 6.8 seconds per vehicle). It should be noted that the total delay added to vehicular traffic is directly related to the number of times the PHB is actuated, and a conservative value was assumed for this analysis in order to show a reasonable worst case scenario on the vehicular impact during the peak hour.

## Table 8: Vehicular Delays with and without Pedestrian Hybrid Beacon

| SimTraffic Results | ${ }^{1}$ Existing | One <br> Pedestrian <br> Hybrid Beacon |
| :---: | :---: | :---: |
| Vehicles Entered | 1908 | 1919 |
| Total Delay (hr) | 2.0 | 3.6 |
| Avg. Delay (sec/veh) | 3.8 | 6.8 |

${ }^{1}$ Without the temporary pedestrian crossing

Based on this investigation, a PHB is a viable option for installation on the west leg of the intersection of Highway 91 at State Street. However, the following challenges would have to be overcome:

- The MUTCD states the PHB should be installed at least 100 feet from side streets or driveways controlled by STOP or YIELD signs. Due to the number of driveways and cross streets within the study area, this spacing will be a challenge to maintain and will likely force the location of the PHB further west than would be ideal for pedestrian use. This may result in less pedestrians using the PHB.

## Hwy. 91 STEP Innovation Study

- Vehicular traffic demonstrated widespread disregard for the temporary crosswalk installation. This poor driver behavior may continue with a PHB installation. To command the attention and respect of drivers, advance stop lines should be placed 20 to 50 feet in advance of the marked crosswalk. The PHB should also be installed in conjunction with ample signage. Increased, ongoing police enforcement will be necessary to ensure proper driver behavior.

### 5.2 Traffic Signal

In order to establish if a traffic signal at the intersection of Highway 91 and State Street would be a feasible countermeasure for the Highway 91 corridor, a traffic signal warrant analysis was performed. The MUTCD standard practice requires that at least one traffic signal warrant be met in order for a traffic signal to be considered at an intersection.

Warrant 1 - Eight-Hour Vehicular Volume
Warrant 2 - Four-Hour Vehicular Volume
Warrant 3 - Peak Hour
Warrant 4 - Pedestrian Volume
Warrant 5 - School Crossing
Warrant 6 - Coordinated Signal System
Warrant 7 - Crash Experience
Warrant 8 - Roadway Network
Warrant 9 - Intersection Near a Grade Crossing

## Warrant 1 - Eight-Hour Vehicular Volume

Warrant 1 typically applies where the volume of intersecting traffic throughout the average day is significant or the intersecting traffic causes excessive delay to the minor street traffic. It is made up of two conditions. Condition A considers the volume of traffic crossing the intersection while Condition $B$ takes into account the delay and number of conflicts for the minor street traffic. Conditions $A$ and $B$ are independent of one another in determining whether or not the warrant is satisfied; however, if neither condition is satisfied for 8 hours of an average day, a combination of the warrants may be considered at $80 \%$ of the required vehicles per hour (vph).

## Warrant 2 - Four-Hour Vehicular Volume

Warrant 2 applies where the volume of intersecting traffic, usually during peak times, is the primary reason for considering a traffic signal. If it is found that, for any four hours of an average day, the side street traffic suffers undue delay which would be remedied by a traffic signal, then, a signal may be justified.

## Warrant 3 - Peak Hour

Warrant 3 typically applies only to facilities that attract or discharge large numbers of vehicles over a short time. It is made up of two conditions. For Condition A, three criteria must occur for this warrant to be met. First, the total stopped time delay for one side street approach must equal or exceed 4 vehicle-hours (one lane approach) or 5 vehiclehours (2 lane approach). Second, the volume for this side street approach must exceed 100 vph (one lane approach) or 150 vph (two-lane approach). Finally, the total volume entering the intersection must exceed 650 vph (one lane approach) or 800 vph (two-lane
approach) for the same hour as the first two criteria. For Condition B, the warrant is determined graphically.

## Warrant 4 - Pedestrian Volume

Warrant 4 applies to a location where the traffic volume on a major street is heavy enough that pedestrians experience excessive delay in crossing the major street. The minimum pedestrian volume should be 133 pedestrians per hour (pph) for one hour or 107 pph for each of four consecutive hours. This minimum volume increases as the major street total volume drops below 1100 vph. Figures 4C-5 thru 4C-8 in the MUTCD are used for Warrant 4.

## Warrant 7 - Crash Experience

Warrant 7 applies to a location where the severity and frequency of crashes deem the need for a traffic signal to be considered. The following three criteria must be met for this warrant:

- Adequate trial of alternatives
- Five or more reported crashes that can be corrected by a traffic signal within a 12month period
- Meet $80 \%$ of the volume criteria for Warrant 1 or Warrant 4.

### 5.2.1 Signal Warrant Analysis

The Highway Capacity Software (HCS) was used to compare 2019 turning movement volumes at the intersection of Highway 91 and State Street against the criteria for signalization established in Warrants 1, 2, and 3. For Warrant 4, 2019 volumes and
corresponding pedestrian volumes were compared to the criteria set forth in Figures 4C5 and 4C-7 in the MUTCD. The pedestrian volumes crossing Highway 91 in the vicinity of the State Street intersection did not meet the minimum pedestrian volume for Warrant 4.

Table 9 summarizes the results of the signal warrant analysis. Refer to Appendix C - Signal Warrants for signal warrant reports. Based on the current information and volumes, a traffic signal is warranted at the intersection of Highway 91 and State Street based on Warrant 7 - Crash Experience.

Table 9: Traffic Signal Warrant Summary

| Warrant | Condition |
| :---: | :---: |
| Warrant 1 | Not Met |
| Warrant 2 | Not Met |
| Warrant 3 | Not Met |
| Warrant 4 | Not Met |
| Warrant 7 | Met |

In order to evaluate the impact to vehicular traffic resulting from the installation of a traffic signal, SimTraffic was used to compare the average delay per vehicle traveling through the study area under existing conditions (without the temporary crossing) versus conditions with a traffic signal at the intersection of Highway 91 at State Street. The models utilized vehicular and pedestrian volumes for the vehicular PM peak hour (4:30 pm to 5:30 pm ) because the PM peak has the highest vehicular volumes and the highest pedestrian volumes. The results of the SimTraffic analysis are provided in
and corresponding Level of Service (LOS) experienced for each vehicular movement at the intersection of Highway 91 at State Street are listed in Table 11. As shown, installing a traffic signal would increase the average delay experienced by drivers within the study area during the busiest peak period by as much as 8.7 seconds per vehicle (an increase from 3.8 seconds per vehicle to 12.5 seconds per vehicle). The delay experienced for each vehicular movement through the intersection as well as the overall operation of the traffic signal corresponds to acceptable LOS B or better.

## Table 10: Vehicular Delays with and without Traffic Signal

| SimTraffic Results | ${ }^{1}$ Existing | Traffic Signal |
| :---: | :---: | :---: |
| Vehicles Entered | 1908 | 1905 |
| Total Delay (hr) | 2 | 6.6 |
| Avg. Delay (sec/veh) | 3.8 | 12.5 |

${ }^{1}$ Without the temporary pedestrian crossing

Table 11: Vehicular Delays and LOS with and without Traffic Signal

| Intersection | Control | MOE | Hwy 91 Movements |  |  |  |  |  | State Street Movements |  |  |  |  |  | Overall |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | EBL | EBT | EBR | WBL | WBT | WBR | NBL | NBT | NBR | SBL | SBT | SBR |  |
| Hwy 91 at <br> State St | Two-Way Stop | Delay (sec/veh) | 6.8 | 2.0 | 1.6 | 4.4 | 0.7 | 0.2 | 22.2 | 32.2 | 7.5 | 26.7 | 28.0 | 7.3 | 2.2 |
|  |  | LOS | A | A | A | A | A | A | C | D | A | D | D | A | A |
|  | Signal | Delay (sec/veh) | 13.5 | 8.6 | 5.6 | 13.1 | 9.1 | 4.5 | 10.9 | 12.4 | 5.3 | 11.5 | 9.7 | 5.0 | 8.9 |
|  |  | LOS | B | A | A | B | A | A | B | B | A | B | A | A | A |

Based on this investigation, a traffic signal is a viable option for installation based on crash history and will provide acceptable levels of service for vehicular traffic with an anticipated overall increase in delay of 8.7 seconds per vehicle. If a traffic signal is implemented, pedestrian accommodations and marked crosswalk(s) should be provided in conjunction with the traffic signal installation.

### 6.0 Conclusions

The purpose of this Traffic Study was to evaluate the effectiveness of the temporary pedestrian signal that was installed across Highway 91 to the west of State Street, identify the pedestrian and bicyclist safety issues that exist, and identify and evaluate potential countermeasures. After the installation of the temporary pedestrian signal, drivers continued to speed and often failed to yield to pedestrians. Crashes continued to occur at a high rate, one of which involved a pedestrian and resulted in injury. Based on these observations, the installation did not effectively improve safety for pedestrians and bicyclists. Therefore, STEP Countermeasure tables were consulted in conjunction with these observations to identify potential countermeasures including a PHB and a traffic signal. These two countermeasures were evaluated for their feasibility as well as their impact to vehicular traffic. The following conclusions were reached concerning the two possible countermeasures:

- Pedestrian Hybrid Beacon (PHB)
- Feasible/warranted
- Less increase in delay to vehicular traffic (up to 3.0 seconds per vehicle when compared to a traffic signal)
- May not command attention and respect of drivers since this has been an issue with the temporary pedestrian signal. To ensure proper driver behavior and safety of pedestrians, increased and ongoing police enforcement will be necessary with the PHB.
- May be difficult to achieve adequate spacing between PHB and driveways/cross streets
- Traffic Signal
- Feasible/warranted
- More increase in delay to vehicular traffic (up to 8.7 seconds per vehicle), but still provides acceptable performance for all vehicular movements and overall for the intersection.
- Likely to resolve issue of vehicles failing to yield to pedestrians without requiring increased and ongoing police enforcement.

### 6.1 Value of Time Lost

The value of time lost due to the installation of the PHB or the traffic signal at the intersection of Highway 91 and State Street was calculated based on the total delays tabulated in Tables 8 and 9. Annualized delays were calculated by multiplying the total delays in the peak hours by the number of workdays per year. The value of lost time was determined by applying the value of travel for automobiles to the difference in annualized delays due to the countermeasure. Table 12 displays various parameters and their values used for value of time lost calculations. The value of automobile travel was determined based on the hourly rate per person and the average occupancy for travel for Craighead County, Arkansas. Table 13 displays the value of time lost due to the installation of either the PHB or the traffic signal.

Table 12: Parameters and Values

| Parameter | Values |
| :---: | :---: |
| ${ }^{1}$ Value of automobile travel ( $\$ /$ hour $)$ | $\$ 21.36$ |
| No. of working days in a year | 250 |

[^5]Table 13: Value of Time Lost

| Alternatives | Annualized <br> Delay (hr) |  |
| :---: | :---: | :---: |
| Value of <br> Time Lost |  |  |
| ${ }^{1}$ Existing | 1000 | - |
| PHB | 1800 | $\$ 17,088.00$ |
| Traffic Signal | 3300 | $\$ 49,128.00$ |

${ }^{1}$ Without the temporary pedestrian crossing

### 6.2 Unit Cost

The unit cost of a PHB and a traffic signal is approximately $\$ 60,000$ and $\$ 190,000$, respectively.

515 West Washington Avenue, Jonesboro, AR, 12345, US

## [N] North

Total: 71
In: $42 \quad$ Out: 29

Out: $47 \quad \ln : 15$
Total: 62
[S] South

Midday Shift 11:30 am to 1:30 pm
Evening Shift
4:00 pm to 6:00 pm

| State Street Intersection |  |  |  |
| :---: | :---: | :---: | :---: |
| Observer | Shift | Pedestrians | Cyclists |
| MPO Staff | AM | 32 | 0 |
|  | Midday | 15 | 0 |
|  | Evening | 26 | 0 |
| Total |  | $\mathbf{7 3}$ | $\mathbf{0}$ |

## Items of Note By Staff

*Citgo gas station appears to be a major destination for pedestrian activity
*Majority pedestrians utilized crossing installation, but a handful from each peak period crossed within just 2-5 feet
(mainly west) of actual crossing installation
*Some pedestrians utilized crossing installation without activating the lights
*A significant number of motorists refused to yield for pedestrians even if crossing lights were activated and/or if pedestrians were actively crossing at installation
*During actual site visits by staff, pedestrians and residents in apartments directly adjacent to crossing installation stated most pedestrian traffic occurs during AM for school \& employment purposes, and that vehicle traffic is not accommodating to that activity

Date of Counts: Wednesday, March 4, $2020 \quad$ *Full video footage of count shift times available as well*
AM Shift 7:00 am to 9:00 am
Midday Shift $\quad 11: 30$ am to $1: 30 \mathrm{pm}$
Evening Shift 4:00 pm to 6:00 pm

| State Street Intersection |  |  |
| :---: | :---: | :---: |
| Observer | Shift | Pedestrians |
| MPO Staff | AM | 21 |
|  | Midday | 26 |
|  | Evening | 33 |
| Total |  | $\mathbf{8 0}$ |

Items of Note By Staff
*Citgo gas station still a popular destination for pedestrian activity
*Majority pedestrians utilized crossing installation, but a number from each peak period crossed within just a few feet east or west of actual crossing installation
*Some pedestrians still utilized crossing installation without activating the lights

## Warrants

## Warrant 1: Eight-Hour Vehicular Volume

A. Minimum Vehicular Volumes (Both major approaches --and-- higher minor approach) --or--
B. Interruption of Continuous Traffic (Both major approaches --and-- higher minor approach) --or--
$56 \%$ Vehicular --and-- Interruption Volumes (Both major approaches --and-- higher minor approach)

## Warrant 2: Four-Hour Vehicular Volume

Four-Hour Vehicular Volume (Both major approaches --and-- higher minor approach)
Warrant 3: Peak Hour
A. Peak-Hour Conditions (Minor delay -- and-- minor volume --and-- total volume) --or--
B. Peak-Hour Vehicular Volumes (Both major approaches --and-- higher minor approach)

Warrant 4: Pedestrian Volume
A. Four Hour Volumes --or--
B. One-Hour Volumes

Warrant 5: School Crossing
Gaps Same Period --and--
Student Volumes
Nearest Traffic Control Signal (optional)
Warrant 6: Coordinated Signal System
Degree of Platooning (Predominant direction or both directions)
Warrant 7: Crash Experience
A. Adequate trials of alternatives, observance and enforcement failed --and--
B. Reported crashes susceptible to correction by signal (12-month period) --and--
C. $56 \%$ Volumes for Warrants 1A, 1B, --or-- 4 are satisfied

## Warrant 8: Roadway Network

A. Weekday Volume (Peak hour total --and-- projected warrants 1, 2, or 3) --or--
B. Weekend Volume (Five hours total)

## Warrant 9: Grade Crossing

A. Grade Crossing within 140 ft --and--
B. Peak-Hour Vehicular Volumes

FINAL REPORT APPENDICES
